

Agile development is a form of software development that utilizes teams that work on everything at the same time. It is generally quicker because everything is being done at the same time. The waterfall method is a much slower method because there are many more checks and balances between stages. The process can be slowed even more by going backwards in the stages in order to ensure everything is done right. The waterfall method is more accurate and ensures that everything is done properly. The agile method is faster but more mistakes can be made due to the rushed process. The waterfall method would be better suited for the developer because all the checks ensure that the code is right and there is less of a chance for the code to fail on release.
